

COMPLETE INSTRUCTION MANUAL

SODIUM

Community Surf App

Sessions, clips, Stoke, chat, events, profiles, invites, and settings.

CURRENT APP · V1.92

Join, sign in, and install Sodium

An invite opens the private community. You can use Google or any email address, finish your profile once, and keep Sodium signed in on that device.

Join from an invite

Open the Sodium link your friend sent. Read the short privacy consent, accept it, and continue to sign in.

- Google: tap Continue with Google and choose the account you want tied to Sodium.
- Any email: enter the email address, request one fresh code, and use only the newest code.
- If you requested more than one code, older codes are cancelled.

Finish your profile

Add your name, profile photo, nickname if you use one, location, sponsors, social link, and the other optional details. Your member profile is visible only inside Sodium.

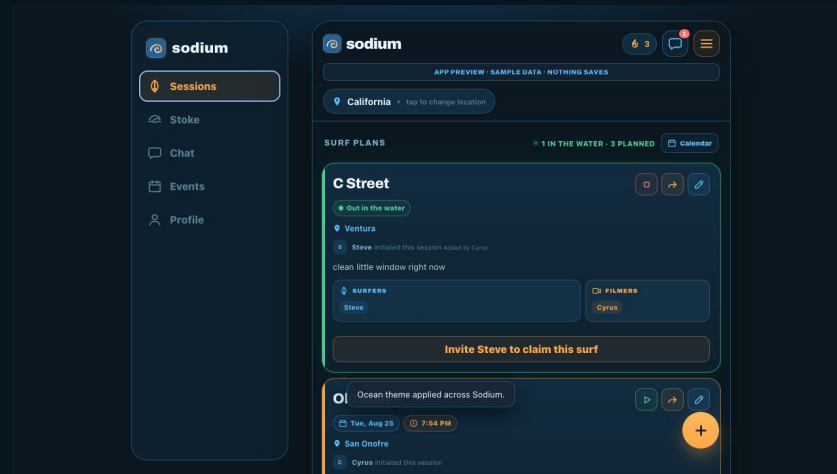

Save the app

On iPhone, open Sodium in Safari, tap Share, then Add to Home Screen. On a computer, use the browser's Install App option when available.

- Install only after signing in so the Home Screen copy opens the community.
- Updates arrive automatically when Sodium is reopened; you do not download a new app each time.

Tell the crew when you are surfing or filming

Sessions replace the disorganized group text. Post a surf now or plan one ahead, then let other members join.

Create a session

Tap +, choose I'm surfing or I'm filming, add the spot, general location, date and time, and an optional note.

- Choose Now for a quick surf or choose a future date and time.
- If you are surfing and want clips, turn on Looking for clips.
- Add known surfers by selecting Sodium members or typing names for people who have not joined yet.

Join, manage, and share the surf

Members can join to surf. A Join to film option appears when the organizer asked for clips.

- The organizer uses Start surf when everyone gets in the water.
- Use Stop surf when it is finished. Only finished sessions award points.
- Use the pencil to edit details or cancel. Cancelled sessions award no points.
- Use the share arrow to send the surf directly to an existing Sodium member, or share an invite outside Sodium.

Send the folder once and track the handoff

The actual videos remain in Google Drive, Dropbox, iCloud, or another HTTPS folder. Sodium stores the link, progress, and session connection.

Create a delivery

From Chat → Clips or the folder button on a past session, tap Send clips. Choose the recipient, add who is in the clips, select the session, paste the folder link, and enter the total/uploaded clip counts.

- Choose a member if they already use Sodium.
- Choose Not on Sodium yet if you are inviting them with the clips.
- If the clips are of someone other than the recipient, enter the actual surfer under Clips of.

Use the right sharing option

For a new member, use Invite to Sodium + send clips. For someone who will not join, use Private clip link - no account.

- The invite version explains Google or email sign-in and opens the delivery after signup.
- The private guest link opens only that clip delivery and does not expose the community.
- The message automatically uses the surf date, spot, location, and a natural first-name greeting.

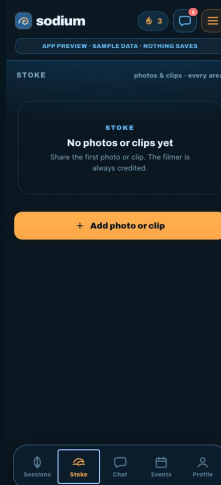

Use the outbox

Open Chat → Clips → Sent. Every delivery stays as a compact row. Tap it to expand progress, open the folder, edit or delete it, resend it, or open the folder again.

- Received contains deliveries another filmer sent to you.
- At the full clip count, the delivery becomes Clips ready automatically.
- If the filmer forgets to mark it ready, manual deliveries become ready after 24 hours.

Share photos and clips without a doomscroll

Stoke is the community-wide highlight area. It is for surf media, proper credit, and useful context - not an algorithmic feed.

Share a highlight

Tap Add photo or clip below the current Stoke posts.

- Photos: upload a carousel of up to 10 images in original, square, portrait, or landscape shape.
- Video: upload up to 5 clips. Each clip can be up to 5 minutes and 1 GB through Cloudflare Stream.
- Choose Photo or Clips first. Credit the photographer or filmer; tags, location, and caption are optional.

Control your own post

Use the pencil on your Stoke post to edit its information or delete it. Deleting removes the post and media from Sodium; points already earned remain.

Coordinate without Instagram

Sodium separates the regional community conversation and private text messages. Clip deliveries are clean folder handoffs, not chats.

Community Chat

Chat is organized by location. Use it to coordinate a surf, ask about conditions, or share a photo from the beach.

- Community Chat allows text and photos.
- It does not accept video clips; share those through Stoke or a clip delivery.
- Change your active location to view that area's chat.

Direct messages

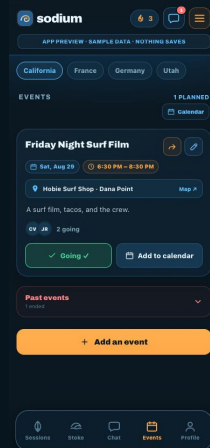

DMs are private, text-only conversations between members. Open the chat icon, choose Messages, and select a member.

Clip deliveries

Clip links open the saved folder. If you need to talk, use a normal DM or text—the delivery itself has no message thread.

Comps, movie nights, and meetups

Events are regional and sit alongside surf sessions in the crew calendar.

Create and share an event

Add the title, date, start/end time, venue, broader location, and description. Use a real venue or address when you want the map link to be useful.

- Members can RSVP.
- Use the share arrow to text the event to someone else.
- The creator can edit or delete the event.

Past events

After the end time, the event moves into Past events. Its card collapses and hides the large location section so history does not take over the page.

Crew calendar

Open Calendar from Sessions or Events. Surf days and event days use different colors; tap a date to see its agenda.

Your identity inside Sodium

Profiles make it easy to know who is in the community and what they contribute without turning Sodium into a follower contest.

Profile and stats

Your profile shows Tokens, active streak, Stoke posts, surf/film time, sessions organized, combined locations, clip handoffs, and clips delivered/received. Only completed sessions count.

Members and locations

View all members from Profile. Locations are created when the community actually needs them, not preloaded as arbitrary surf regions.

- Choose your active location from the location pill.
- When traveling, add or join the relevant place to see its sessions, events, and chat.

Marketplace and Perks

Marketplace is a directory of what members make or do. Transactions happen directly with the member; Sodium has no cart, checkout, or commission. Perks contains broader community discounts.

Reward real participation

Stokens reward surfing, filming, sharing, and showing up. They are not based on likes, followers, or scrolling.

Current Stokens

15 Stokens: share Stoke. 10: finish a surf you initiated. 10: RSVP to an event. 5: surf or film a finished session. 3: useful comment. +5: first qualifying activity of the day.

Organizer credit

The person who made the plan receives organizer credit, even if an admin typed the session into Sodium for them.

- A nonmember can claim the session through the invitation link.
- Admins can correct the initiator later when needed.
- Points are awarded once when the surf is finished, not when it is merely posted or started.

Active streak

A qualifying activity on a new day adds one active day. Multiple activities on the same day still earn points but add only one streak day. After more than seven inactive days, the next activity restarts the streak at one.

Bring in the homies with the right context

The Share + Invite menu has a different route for each real situation, plus the clip outbox for deliveries already created.

Four invite routes

Choose the option that matches what is actually happening.

- Invite them to join Sodium: a simple community invite.
- Invite them to plan a surf: they create the session and receive organizer credit.
- Invite them to claim a surf: you entered their plan; they join and take it over.
- Send clips + invite to Sodium: their delivery opens after signup.

Notification settings

On iPhone, install Sodium first, then open Settings → Notifications and tap Enable notifications on this device.

- Choose alerts for new members, surfs, Stoke, DMS, clip deliveries, events, session updates, and Community Chat.
- New members alerts you when someone redeems an invite you created.
- Sodium does not notify you about your own action.

Keep Sodium simple and working

The app updates automatically, stores your session on the device, and includes direct issue reporting for beta testing.

Updates

Reopen Sodium when a new version is released. The service worker refreshes the app files automatically. A small What's New card explains meaningful changes.

Report an issue

Open Settings → Report an issue. Describe what happened, what you expected, and attach a screenshot when useful. Admins can review reports in Beta Feedback.

Privacy boundaries

Sodium is private and invite-only. There are no ads and member information is not sold.

- Stoke media is community-visible.
- DMs and clip-delivery conversations are limited to the participants.
- A guest clip link opens only that delivery.
- Supabase Row Level Security protects member data; the public app contains only the publishable client key.

Quick troubleshooting

Wrong email code? Request one fresh code and use only the newest. No notifications? Install Sodium to the iPhone Home Screen and enable alerts inside Settings. Old screen? Fully close and reopen the app. Missing delivery? Open Chat → Clips → Sent.
